## 1 Task 1

## 1.1 CFA to construct a measurement model for the Attitude items

There are 9 attitude items that are scored on a five-point Likert scale. To conduct CFA on the attitude items using the covariance matrix, we first center the data.

## 1.1.1 A simple 3-factor model

We first conduct a simple confirmatory factor analysis, assuming each item only has a loading on the concept it aims to measure (organic, packaging, and cruelty free). We will assume the the three latent variables are correlated and the factor loading of the first indicator of each latent variable is fixed to 1. We fit the model on standardized data. The first columns in Table ?? shows several performance measures for the model. It shows that the currently proposed 3-factor model is not a good fit. The chi-squared goodness of fit tests indicate that the constraints imposed by the model are not supported (p < 0.001). The cutoff for a good model for CFI and TLI (cutoff > 0.95) and for RMSEA and SRMR (cutoff < 0.08) are also not satisfied. Figure 1 shows a graphical representation of the model, including all loadings (which are equal to the covariance between the variable and the factor since the data was first standardized), correlations and variances.

In the standardized solution, the standardized loadings represent correlations between a variable and a factor (Table 1) and the error variances indicate the proportion of the variance in a variable that cannot be explained by the model (Table 1).

```
#We first standardize the variables
cosmetics std <- scale(cosmetics, center = TRUE, scale = FALSE)
covmat1 <- cov(cosmetics_std[,1:9])</pre>
simplemodel1 <-
'organic = ~1*A_organic1 + A_organic2 + A_organic3
 packaging = ~1*A_packaging1 + A_packaging2 + A_packaging3
  crueltyfree = ~1*A_crueltyfree1 + A_crueltyfree2 + A_crueltyfree3
 organic ~~ organic
 packaging ~~ packaging
  crueltyfree ~~ crueltyfree
 organic ~~ packaging
 organic ~~ crueltyfree
 packaging ~~ crueltyfree'
fit1 <- cfa(simplemodel1, sample.cov = covmat1, sample.nobs = nrow(cosmetics))</pre>
sum_fit1 <- summary(fit1, fit.measure = T)</pre>
sum_fit1_std <- standardizedSolution(fit1)</pre>
```

#### 1.1.2 A 3-factor model with correlated error terms

Since the simple 3-factor model does not seem to perform well, we alter the model by including correlated error terms for all pairs of items that focus on the same aspect. We also impose equal residual correlations for all pairs of items that focus on the same aspect.

Table 1: The solution of the simple model for the attitudes.

#### 1.1.3 Conclusion

An anova test between the two models shows that the model with correlated error terms is significantly better ( p-value < 0.001).

Since, however, the performance measures (second column in Table ??) shows less-than-perfect fit, we look at the residual correlations and notice that 7 (19.44%) of all correlations are larger than 0.05 or smaller than -0.05. Three of the largest residual correlations involved the correlations between A\_organic3, A\_packaging3, and A\_crueltyfree3 which leads us to believe that the assumption that these correlations are equal does not hold. Indeed, a model that relaxes this assumption has a good TLI (0.967), CFI (0.983), RMSEA (0.073), and SRMR (0.031). The Chi-square goodness of fit test still has a p-value of 0.018

Table 3: The standardized solution of the simple model for the behavior-intent items.

packaging =~ BI_packaging3	0.85 (0.80, 0.90)***	27	BI_organic3	0.27 (0.18, 0.36)***
crueltyfree =~ BI_crueltyfree1	0.92 (0.89, 0.95)***	28	BI_packaging1	0.23 (0.15, 0.31)***
crueltyfree =~ BI_crueltyfree2	0.92 (0.88, 0.95)***	29	BI_packaging2	0.20 (0.12, 0.27)***
crueltyfree =~ BI_crueltyfree3	0.94 (0.91, 0.97)***	30	BI_packaging3	0.27 (0.18, 0.36)***
		31	BI_crueltyfree1	0.15 (0.10, 0.21)***
		32	BI_crueltyfree2	0.16 (0.10, 0.22)***
		33	BI_crueltyfree3	0.12 (0.06, 0.17)***

	resid.correlation	value
10	BI_organic1 ~~ BI_packaging1	0.32 (0.17, 0.46)***
11	BI_organic1 ~~ BI_crueltyfree1	0.36 (0.20, 0.52)***
12	BI_packaging1 ~~ BI_crueltyfree1	0.36 (0.20, 0.52)***
13	BI_organic2 ~~ BI_packaging2	0.51 (0.36, 0.65)***
14	BI_organic2 ~~ BI_crueltyfree2	0.51 (0.36, 0.65)***
15	BI_packaging2 ~~ BI_crueltyfree2	0.54 (0.39, 0.68)***
16	BI_organic3 ~~ BI_packaging3	0.22 (0.10, 0.35)***
17	BI_organic3 ~~ BI_crueltyfree3	0.31 (0.15, 0.48)***
18	BI_packaging3 ~~ BI_crueltyfree3	0.32 (0.15, 0.49)***

The performance measures (column 4 in Table ??) show a good fit and most residual correlations are between -0.05 and 0.05 (only 0 have an absolute value that is slightly higher with a maximum of 0.049). We shall thus keep this model as the final model.

# 1.3 Structural equation model to evaluate the impact of attitude on behavior intention

With a test statistics of 149.47 with 120 degrees of freedom, the chi-square p-value is 0.0353331 which means we cannot reject the null hypothesis that the model fits well.

```

The structural equation model shows that all correlations between latent variables are positive and highly significant.

- an increase of one unit in attitude\_organic increases the behavior intention with 0.684.
- an increase of one unit in attitude packaging increases the behavior intention with 0.681.
- an increase of one unit in attitude\_crueltyfree increases the behavior intention with 0.718.

These population regression coefficients are quite similar so we next test a model that imposes that all three regression coefficients are the same.

## 1.3.1 The same population regression coefficient

```

```

Since an anova test for the two sem models has a p-value of 0.264, we cannot reject the null hypothesis that the models are the same, meaning this new, simpler SEM fits as well as the more elaborate model.

- an increase of one unit in attitude organic increases the behavior intention with 0.693.
- an increase of one unit in attitude packaging increases the behavior intention with 0.71.
- an increase of one unit in attitude\_crueltyfree increases the behavior intention with 0.686.

## 2 Task 2

## 2.1 Canonical correlation analysis

```
